

Important information for the update from QMSOFT4W (16bit, Release 2.xx) to the QMSOFT® Release 5 system

This document contains important information on the changeover from the 16-bit version of QMSOFT® to the actual QMSOFT® system.

License codes

Please note that the license codes for the various QMSOFT® program modules in QMSOFT4W and also the dongles are not valid for the use in QMSOFT® Release 5.0 system. However, you will of course receive a new unlocking code and a new dongle with your update delivery.

Data conversion

Naturally, the data stocks contained in QMSOFT4W can as well be used in the QMSOFT® Gauge Management System Release 5.0 after the conversion of the data from the previously used Paradox format to the format needed for the Firebird SQL server. You will receive a conversion tool free of charge with your update delivery. Should problems occur with the conversion, L&W offers a conversion service at customer's request and costs.

Data transfer

For all users who in the previous system exchanged gauge data between different data stocks (e.g. the transfer of calibration results from the calibration service provider to the customer) a transfer tool has been developed, which supports the data exchange within the QMSOFT® Gauge Management System.

Changeover of predefined certificate layout files

The actual QMSOFT® gauge management system utilizes a new technology for the generation of inspection certificates and other documents. Therefore, the files containing predefined certificate layouts used in the old QMSOFT4W system (file name ending in ,lw2' in the proprietary High-Edit format) can not automatically be taken over into the new system. However, your new version encompasses the respective predefined protocols. So by and large, all you will have to do is entering your company's name, address and logo and specific data like uncertainties of measurement etc.
